

Numbers

Types of Numbers:

- Natural Numbers: $\mathbb{N} = \{1, 2, 3, \dots\}$
- Whole Numbers: $\mathbb{N} \cup \{0\} = \{0, 1, 2, 3, \dots\}$
- Integers: $\mathbb{Z} = \{\dots, -2, -1, 0, 1, 2, \dots\}$
- Rational Numbers: $\mathbb{Q} = \{\frac{a}{b} : a, b \in \mathbb{Z}, b \neq 0\}$. Rational Numbers comprise of fractions (includes all proper and improper fractions and mixed numbers). All terminating decimals (eg, 10.87) and recurring decimals (eg, $0.3\dot{7}1 = 0.3717171\dots$) are rational numbers because these can all be expressed as fractions. All integers are rational numbers.
- Irrational Numbers: numbers that cannot be expressed in the form $\frac{a}{b}$, where a and b are integers and $b \neq 0$. Eg. π , $\sqrt{2}$, $\sqrt{5}$, $-4\sqrt{7}$, e , $2.75e$, etc. Irrational numbers are non-recurring decimals. Any non-zero rational number multiplied to an irrational number results in an irrational number. For example, $-\frac{3}{4}\pi$ is irrational.
- Perfect Squares: $\{1, 4, 9, 16, 25, \dots\}$
- Perfect Cubes: $\{1, 8, 27, 64, \dots\}$
- Prime Numbers: Positive integers at least 2 whose only positive divisors are 1 and itself. $\{2, 3, 5, 7, 11, 13, 17, 19, 23, \dots\}$

Equality and Inequality Symbols

Symbol	Meaning	Example
=	is equal to	$0.1 = \frac{1}{10}$
≠	is not equal to	$0.11 \neq \frac{1}{10}$
>	is greater than	$0.1 > 0.01$
≥	is greater than or equal to	$a \geq 5$
<	is less than	$0.05 < 5$
≤	is less than or equal to	$b \leq 5$

Prime Factorization, HCF, LCM

- Example of prime factorization:

2	4356
2	2178
3	1089
3	363
11	121
	11

Hence $4356 = 2^2 \times 3^2 \times 11^2$ (in index notation).

- Example of HCF and LCM using prime factorization:

$$4800 = 2^6 \times 3 \times 5^2$$

$$5544 = 2^3 \times 3^2 \times 7 \times 11$$

$$\text{HCF} = 2^3 \times 3$$

[take common prime factors and lowest power of each]

$$\text{LCM} = 2^6 \times 3^2 \times 5^2 \times 7 \times 11$$

[take all prime factors and highest power of each]

- Examples of square roots and cube roots using prime factorization:

$$54756 = 2^2 \times 3^4 \times 13^2$$

$$\sqrt{54756} = 2 \times 3^2 \times 13 = 234$$

$$1728 = 2^6 \times 3^3$$

$$\sqrt[3]{1728} = 2^2 \times 3 = 12$$

Approximation

Significant Figures

Rules of identifying number of significant digits:

1. All non-zero digits are significant.
2. Zeros between non-zero digits are significant.
Eg. 302 (3 sf)
Eg. 10.2301 (6 sf)
3. In a whole number, zeros after the last nonzero digit may or may not be significant. It depends on the estimation being made.

Eg.

$$7436000 = 7000000 \text{ (1 sf)}$$

$$7436000 = 7400000 \text{ (2 sf)}$$

$$7436000 = 7440000 \text{ (3 sf)}$$

$$7436000 = 7436000 \text{ (4 sf)}$$

$$7436000 = 7436000 \text{ (5 sf)}$$

$$7436000 = 7436000 \text{ (6 sf)}$$

4. In a decimal number, zeros before the 1st non-zero digit are not significant.

Eg. 0.004 (1 sf)

Eg. 0.07008 (4 sf)

5. In a decimal number, zeros after the last non-zero digit are significant.

Eg. 6.40 (3 sf)

Eg. 12.000 (5 sf)

Eg. 20300.000 (8 sf)

Eg. 0.0700800 (6 sf)

Decimal Place Rounding

Examples:

$$0.7374 = 0.74 \text{ (2 dp)}$$

$$58.301 = 58.30 \text{ (2 dp)}$$

$$207.6296 = 207.630 \text{ (3 dp)}$$

$$207.6296 = 207.63 \text{ (2 dp)}$$

$$207.977 = 208.0 \text{ (1 dp)}$$

$$207.977 = 207.98 \text{ (2 dp)}$$

$$18.997 = 19.00 \text{ (2 dp)}$$

Standard Form

$\pm A \times 10^n$, where $1 \leq A < 10$ and n is an integer.

Examples:

$$1350000 = 1.35 \times 10^6$$

$$0.000375 = 3.75 \times 10^{-4}$$

Common Prefixes

10^{12}	trillion	tera	T
10^9	billion	giga	G
10^6	million	mega	M
10^3	thousand	kilo	k
10^{-3}	thousandth	milli	m
10^{-6}	millionth	micro	μ
10^{-9}	billionth	nano	n
10^{-12}	trillionth	pico	p

Indices

Rules of Indices:

Assume that a, b, m, n are non-zero.

$$a^0 = 1$$

$$a^m \times a^n = a^{m+n}$$

$$a^m \div a^n = a^{m-n}$$

$$(ab)^n = a^n b^n$$

$$\left(\frac{a}{b}\right)^n = \frac{a^n}{b^n}$$

$$(a^n)^m = a^{nm}$$

$$a^{-n} = \frac{1}{a^n}$$

$$\left(\frac{a}{b}\right)^{-n} = \left(\frac{b}{a}\right)^n = \frac{b^n}{a^n}$$

$$a^{\frac{1}{n}} = \sqrt[n]{a}$$

$$a^{\frac{m}{n}} = \sqrt[n]{a^m} = (\sqrt[n]{a})^m$$

Caution:

- For indices (powers) that are not integers, the above rules of indices hold only for $a, b > 0$.
- Likewise, if some of the indices are negative or there is division by either a or b , then the above rules hold only for $a, b > 0$.
- $\sqrt{(-8)^2} = \sqrt{64} = 8$, NOT -8 .
- $\sqrt[3]{-27} = -3$.

Equalities of Indices:

- If $a^m = a^n$, then $m = n$.
- If $a^m = b^m$, then $a = b$.

Percentage, Ratio, Rate

- To express a percentage as a fraction or decimal, divide by 100:

$$x\% = \frac{x}{100}$$

$$\text{Eg, } 23.5\% = \frac{23.5}{100} = \frac{235}{1000} = \frac{47}{200}$$

$$\text{Eg, } 401\% = \frac{401}{100} = 4.01$$

- To express any number as a percentage, multiply it by 100%.

$$\text{Eg, } 0.165 = 0.165 \times 100\% = 16.5\%.$$

- Expressing a quantity A as a percentage of a quantity B :

$$\frac{A}{B} \times 100\%$$

Eg, Express 63.7 as a percentage of 98.

$$\text{Answer: } \frac{63.7}{98} \times 100\% = 65\%$$

In words, we say that 63.7 is 65% of 98.

- Increase or decrease a quantity by a given percentage:

Eg, Increase 45 by 2.4%:

$$\text{Answer: } 45 \times \left(1 + \frac{2.4}{100}\right) = 45 \times 1.024 = 46.08$$

Eg, Decrease 45 by 90%:

$$\text{Answer: } 45 \times \left(1 - \frac{90}{100}\right) = 45 \times 0.1 = 4.5$$

- Percentage Increase and Percentage Decrease:

When a quantity increases, the percentage increase is

$$\frac{\text{final value} - \text{initial value}}{\text{initial value}} \times 100\%$$

When a quantity decreases, the percentage decrease is

$$\frac{\text{initial (bigger) value} - \text{final (smaller) value}}{\text{initial value}} \times 100\%$$

Percentage increase will always be > 0 if the quantity has increased.

Percentage decrease will always be > 0 if the quantity has decreased.

Percentage change is

$$\frac{\text{final value} - \text{initial value}}{\text{initial value}} \times 100\%$$

regardless of whether the quantity has increased or decreased. Percentage change can be either

positive or negative depending on whether the quantity has increased or decreased.

- When writing ratios such as $a : b$, a, b are positive integers. Always reduce ratios to the simplest form, eg, $10 : 6$ is to be reduced to $5 : 3$. The ratio $a : b$ expressed in fraction form is $\frac{a}{b}$.

Eg, If 7 times of x is equal to 5 times of y , then $x : y = 5 : 7$ (note the switching of the order)

- We can use ratios to increase and decrease quantities. For example, if we increase a quantity x in the ratio $6 : 5$, the new quantity is $\frac{6}{5}x$; if we decrease a quantity x in the ratio $5 : 6$, the new quantity is $\frac{5}{6}x$.

- Various units of measurement:

Mass:

$$1 \text{ kg} = 1000 \text{ g}$$

$$1 \text{ g} = 1000 \text{ mg}$$

Length:

$$1 \text{ km} = 1000 \text{ m}$$

$$1 \text{ m} = 100 \text{ cm}$$

$$1 \text{ cm} = 10 \text{ mm}$$

Area:

$$1 \text{ km}^2 = 10^6 \text{ m}^2$$

$$1 \text{ m}^2 = 10000 \text{ cm}^2$$

Volume:

$$1 \text{ l} = 1000 \text{ ml}$$

$$1 \text{ cm}^3 = 1 \text{ ml}$$

$$1 \text{ m}^3 = 10^6 \text{ cm}^3 = 1000 \text{ l}$$

Time:

$$1 \text{ hr} = 60 \text{ min}$$

$$1 \text{ min} = 60 \text{ sec}$$

- Distance = Speed \times Time

- Average speed = (Total Distance) / (Total Time Taken)

- Conversion of units for speed:

$$26\text{km/h} = 26000\text{m/h} = \frac{26000}{3600}\text{m/s} = \frac{65}{9}\text{m/s}$$

$$35\text{m/s} = 0.035\text{km/s} = (0.035 \times 3600)\text{km/h} = 126\text{km/h}$$

- Density = Mass / Volume.

Units are usually g/cm^3 or kg/m^3 .

$$1\text{g/cm}^3 = 1000\text{kg/m}^3.$$

$$\text{Eg, } 0.235\text{g/cm}^3 = 235\text{kg/m}^3.$$

Direct and Inverse Proportion

If y is directly proportional to x , then $y = kx$, where k is a constant and $k \neq 0$. The ratios $\frac{x}{y}$ and $\frac{y}{x}$ are constant. Furthermore, the graph on y against x (or of x against y) is a straight line through the origin. Graph showing that y is directly proportional to x :

If y is inversely proportional to x , then $y = \frac{k}{x}$, where k is a constant and $k \neq 0$. The product xy is constant.

Graph showing that y is inversely proportional to x :

Map Scales

- Linear scale:

$1 : n$ means 1 unit length on map represents n units length on ground.

Eg. $1 : 5000$ means

1 cm represents 5000 cm

which implies 1 cm represents 50 m

which implies 1 cm represents 0.05 km

- Representative Fraction (RF):

If the linear scale is $1 : n$, the RF is expressed as $\frac{1}{n}$.

Eg, if 3 cm represents 6 m, then RF is $\frac{1}{200}$.

- Area Scale:

If linear scale is $1 : 20000$, then it means

1 cm represents 20000 cm

which implies 1 cm represents 0.2 km

which implies 1^2 cm^2 represents $(0.2)^2 \text{ km}^2$

which implies 1 cm^2 represents 0.04 km^2

Number Patterns

Common number patterns:

- Constant difference

Eg, $-5, -2, 1, 4, 7, 10, \dots$

The n^{th} term, denoted T_n , is given by

$$T_n = a + d(n - 1)$$

where a is the first term and d is the common difference.

For the sequence $-5, -2, 1, 4, 7, 10, \dots$,

$$T_n = -5 + (n - 1)(3) = 3n - 8.$$

Alternatively,

$$T_n = b + dn$$

where b is the term that would have come before the first term (ie, the “zeroth” term).

- Constant multiple (or common ratio)

Eg, 3, 15, 75, 375, ...

$$T_n = a \times r^{n-1}$$

where a is the first term, r is the common ratio, that is, r is the number that when multiplied a term gives the next term.

For the sequence 3, 15, 75, 375, ...

$$T_n = 3 \times 5^{n-1}$$

- Perfect squares and perfect cubes

$$1, 4, 9, 16, 25, \dots : T_n = n^2$$

$$1, 8, 27, 64, 125, \dots : T_n = n^3$$

$$2, 8, 18, 32, 50, \dots : T_n = 2n^2$$

$$3, 10, 29, 66, 127, \dots : T_n = n^3 + 2$$

Algebra

Simultaneous Linear Equations

Method 1: Elimination

$$5x - 2y = 21 \quad \text{---(1)}$$

$$2x - y = 8 \quad \text{---(2)}$$

$$(1) \times 2 : 10x - 4y = 42 \quad \text{---(3)}$$

$$(2) \times 5 : 10x - 5y = 40 \quad \text{---(4)}$$

$$(3) - (4) : y = 2$$

$$\text{Sub into (1): } 5x - 2(2) = 21$$

$$5x - 4 = 21$$

$$5x = 25$$

$$x = 5$$

Method 2: Substitution

$$5x - 2y = 21 \quad \text{---(1)}$$

$$2x - y = 8 \quad \text{---(2)}$$

From (2):

$$y = 2x - 8 \quad \text{---(3)}$$

$$\text{Sub (3) into (1): } 5x - 2(2x - 8) = 21$$

$$5x - 4x + 16 = 21$$

$$x - 16 = 21$$

$$x = 5$$

Sub into (2):

$$2(5) - y = 8$$

$$10 - y = 8$$

$$y = 2$$

Expansion

Eg.

$$2p - 3(p + 1)$$

$$= 2p - 3p - 3$$

$$= -p - 3$$

Eg.

$$5x - (x + 1)(2x - 3)$$

$$= 5x - (2x^2 - 3x + 2x - 3)$$

$$= 5x - 2x^2 + 3x - 2x + 3$$

$$= -2x^2 + 6x + 3$$

Factorization and Identities

Factorization of Quadratic Expressions:

$$5x^2 + 9x - 2$$

\times	$5x$	-1
x	$5x^2$	$-x$
2	$10x$	-2

$$\therefore 5x^2 + 9x - 2 = (5x - 1)(x + 2)$$

Identities:

$$1. (a + b)^2 = a^2 + 2ab + b^2$$

$$2. (a - b)^2 = a^2 - 2ab + b^2$$

$$3. (a + b)(a - b) = a^2 - b^2$$

Common Factorisation Techniques:

- Common Factors

$$\text{Eg. } 6a^3b - 2a^2b = 2a^2b(3a - 1)$$

- Grouping

Eg.

$$6p^2 - 3pq - 10ap + 5aq$$

$$= 3p(2p - q) - 5a(2p - q)$$

$$= (3p - 5a)(2p - q)$$

- Using Difference of Two Squares

$$\text{Eg. } 9a^2 - 1$$

$$= (3a)^2 - (1)^2$$

$$= (3a + 1)(3a - 1)$$

$$\begin{aligned}
&\text{Eg. } 16a^4 - 81 \\
&= (4a^2 + 9)(4a^2 - 9) \\
&= (4a^2 + 9)(2a + 3)(2a - 3)
\end{aligned}$$

- Combination of methods:

$$\begin{aligned}
&\text{Eg. } 3x^3 - 12xy^2 = 3x(x^2 - 4y^2) \text{ common factor} \\
&= 3x(x + 2y)(x - 2y) \text{ then diff. of 2 squares}
\end{aligned}$$

Always try common factor first

Eg.

$$\begin{aligned}
&4 - p^2 + 6pq - 9q^2 \\
&= 4 - (p^2 - 6pq + 9q^2) \\
&= (2)^2 - (p - 3q)^2 \\
&= (2 + (p - 3q))(2 - (p - 3q)) \\
&= (2 + p - 3q)(2 - p + 3q)
\end{aligned}$$

Algebraic Fractions

Eg.

$$\begin{aligned}
&\frac{x+2}{3} - \frac{x-5}{2} \\
&= \frac{2(x+2) - 3(x-5)}{6} \\
&= \frac{2x+4-3x+15}{6} \\
&= \frac{19-x}{6}
\end{aligned}$$

Eg.

$$\begin{aligned}
&\frac{5}{x+1} - \frac{2}{x-3} \\
&= \frac{5(x-3) - 2(x+1)}{(x+1)(x-3)} \\
&= \frac{5x-15-2x-2}{(x+1)(x-3)} \\
&= \frac{3x-17}{(x+1)(x-3)}
\end{aligned}$$

Eg.

$$\begin{aligned}
&\frac{5}{3x} + \frac{2}{x} \\
&= \frac{5}{3x} + \frac{6}{3x} \\
&= \frac{5+6}{3x} \\
&= \frac{11}{3x}
\end{aligned}$$

Eg.

$$\begin{aligned}
&\frac{3}{(x+2)^2} - \frac{4}{x+2} \\
&= \frac{3}{(x+2)^2} - \frac{4(x+2)}{(x+2)^2} \\
&= \frac{3-4(x+2)}{(x+2)^2} \\
&= \frac{3-4x-8}{(x+2)^2} \\
&= \frac{-4x-5}{(x+2)^2}
\end{aligned}$$

Eg.

$$\begin{aligned}
&\frac{7}{x^2-9} - \frac{1}{x-3} \\
&= \frac{7}{(x+3)(x-3)} - \frac{1}{x-3} \\
&= \frac{7}{(x+3)(x-3)} - \frac{x-3}{(x-3)^2} \\
&= \frac{7-(x+3)}{(x+3)(x-3)} \\
&= \frac{7-x-3}{(x+3)(x-3)} \\
&= \frac{4-x}{(x+3)(x-3)}
\end{aligned}$$

Eg.

$$\begin{aligned}
&\frac{9}{x-5} + \frac{3}{5-x} \\
&= \frac{9}{x-5} - \frac{3}{x-5} \\
&= \frac{9-3}{x-5} \\
&= \frac{6}{x-5}
\end{aligned}$$

Eg.

$$\begin{aligned} & \frac{2x}{3y-8x} + \frac{11x}{80x-30y} \\ &= \frac{2x}{3y-8x} + \frac{11x}{-10(3y-8x)} \\ &= \frac{2x}{3y-8x} - \frac{11x}{10(3y-8x)} \\ &= \frac{20x-11x}{10(3y-8x)} \\ &= \frac{9x}{10(3y-8x)} \end{aligned}$$

Eg.

$$\begin{aligned} & \frac{6p^3}{7q} \div \frac{2p}{21q^2} \\ &= \frac{6p^3}{7q} \times \frac{21q^2}{2p} \quad [\text{do cancelling}] \\ &= 9p^2q \end{aligned}$$

Eg.

$$\begin{aligned} \frac{4pq^2 + 4pqr}{9pqr^2 + 9pq^2r} &= \frac{4pq(q+r)}{9pqr(r+q)} \\ &= \frac{4}{9r} \end{aligned}$$

Eg.

$$\begin{aligned} \frac{5k^2 - 17k - 12}{5k^2 - 10k - 40} &= \frac{(5k+3)(k-4)}{5(k^2-2k-8)} \\ &= \frac{(5k+3)(k-4)}{5(k-4)(k+2)} \\ &= \frac{5k+3}{5(k+2)} \end{aligned}$$

Eg.

$$\begin{aligned} & \frac{xy - z^2 - xz + yz}{y^2 - 2yz + z^2} \div \frac{11}{2xz + x^2 + z^2} \\ &= \frac{xy - xz + yz - z^2}{y^2 - 2yz + z^2} \times \frac{2xz + x^2 + z^2}{11} \\ &= \frac{x(y-z) + z(y-z)}{(y-z)^2} \times \frac{(x+z)^2}{11} \\ &= \frac{(x+z)(y-z)}{(y-z)^2} \times \frac{(x+z)^2}{11} \\ &= \frac{(x+z)^3}{11(y-z)} \end{aligned}$$

Inequalities

Inequality sign is reversed when both sides are multiplied or divided by a negative number.

Eg. $-3x + 4 \geq 12$

$$-3x \geq 12 - 4$$

$$-3x \geq 8$$

$$x \leq -\frac{8}{3}$$

Eg. $3(x-1) < 4x+1 \leq 7+2x$

$$\begin{array}{l|l} 3(x-1) < 4x+1 & 4x+1 \leq 7+2x \\ 3x-3 < 4x+1 & 4x-2x \leq 7-1 \\ 3x-4x < 1+3 & 2x \leq 6 \\ -x < 4 & x \leq 3 \\ x > -4 & \end{array}$$

Ans: $-4 < x \leq 3$

Eg. $5x+4 \leq 3x < 6-3x$

$$\begin{array}{l|l} 5x+4 \leq 3x & 3x < 6-3x \\ 2x \leq -4 & 6x < 6 \\ x \leq -2 & x < 1 \end{array}$$

Ans: $x \leq -2$.

Making Subject of Formula

Eg: Make a the subject

$$y = m(x-a) + b$$

$$y - b = m(x-a)$$

$$m(x-a) = y-b$$

$$x-a = \frac{y-b}{m}$$

$$a = x - \frac{y-b}{m}$$

Eg: Make x the subject

$$ax - by = 3 - 2x$$

$$ax + 2x = 3 + by$$

$$x(a + 2) = by + 3$$

$$x = \frac{by + 3}{a + 2}$$

Eg: Make d the subject

$$T = 0.25\pi d^2$$

$$\pi d^2 = 4T$$

$$d^2 = \frac{4T}{\pi}$$

$$d = \pm \sqrt{\frac{4T}{\pi}}$$

Note the \pm when taking square-roots in this type of question.

Eg: Make c the subject

$$d = \frac{8 - c}{c + 7}$$

$$d(c + 7) = 8 - c$$

$$cd + 7d = 8 - c$$

$$cd + c = 8 - 7d$$

$$c(d + 1) = 8 - 7d$$

$$c = \frac{8 - 7d}{d + 1}$$

Eg: Make q the subject

$$5a = \sqrt{\frac{b^2}{q} - \frac{3c}{4}}$$

$$25a^2 = \frac{b^2}{q} - \frac{3c}{4}$$

$$\frac{b^2}{q} = 25a^2 + \frac{3c}{4}$$

$$\frac{b^2}{q} = \frac{100a^2 + 3c}{4}$$

$$\frac{q}{b^2} = \frac{4}{100a^2 + 3c}$$

$$q = \frac{4b^2}{100a^2 + 3c}$$

Eg: Make y the subject

$$\frac{x(yz - w^2)}{2} - \frac{y}{3} = 6y$$

$$3x(yz - w^2) - 2y = 36y$$

$$3xyz - 3w^2x - 2y = 36y$$

$$3xyz - 38y = 3w^2x$$

$$y(3xz - 38) = 3w^2x$$

$$y = \frac{3w^2x}{3xz - 38}$$
