Numbers

Types of Numbers:

- Natural Numbers: $\mathbb{N} = \{1, 2, 3, \ldots\}$
- Whole Numbers: $\mathbb{N} \cup \{0\} = \{0, 1, 2, 3, \ldots\}$
- Integers: $\mathbb{Z} = \{\ldots, -2, -1, 0, 1, 2, \ldots\}$
- Rational Numbers: $\mathbb{Q} = \left\{\frac{a}{b} \ : \ a, b \in \mathbb{Z}\ ,\ b \neq 0\right\}$. Rational Numbers comprise of fractions (includes all proper and improper fractions and mixed numbers). All terminating decimals (eg, 10.87) and recurring decimals (eg, $0.3\dot{7}\dot{1} = 0.3717171\ldots$) are rational numbers because these can all be expressed as fractions. All integers are rational numbers.
- Irrational Numbers: numbers that cannot be expressed in the form $\frac{a}{b}$, where a and b are integers and $b \neq 0$. Eg. π, $\sqrt{2}$, $\sqrt{5}$, $-4\sqrt{7}$, e, $2.75e$, etc. Irrational numbers are non-recurring decimals. Any non-zero rational number multiplied to an irrational number results in an irrational number. For example, $-\frac{3}{4}\pi$ is irrational.
- Perfect Squares: $\{1, 4, 9, 16, 25, \ldots\}$
- Perfect Cubes: $\{1, 8, 27, 64, \ldots\}$
- Prime Numbers: Positive integers at least 2 whose only divisors are 1 and itself. $\{2, 3, 5, 7, 11, 13, 17, 19, 23, \ldots\}$

Equality and Inequality Symbols

Symbol	Meaning	Example
$=$	is equal to	$0.1 = \frac{1}{10}$
$\neq$	is not equal to	$0.11 \neq \frac{1}{10}$
$>$	is greater than	$0.1 > 0.01$
$\geqslant$	is greater than or equal to	$a \geqslant 5$
$<$	is less than	$0.05 < 5$
$\leqslant$	is less than or equal to	$b \leqslant 5$

Prime Factorization, HCF, LCM

Example of prime factorization:

$$\begin{array}{r|c} 2 & 4356 \\ \hline 2 & 2178 \\ \hline 3 & 1089 \\ \hline 3 & 363 \\ \hline 11 & 121 \\ \hline & 11 \\ \hline \end{array}$$

Hence $4356 = 2^2 \times 3^2 \times 11^2$ (in index notation).

Example of HCF and LCM using prime factorization:
$4800 = 2^6 \times 3 \times 5^2$
$5544 = 2^3 \times 3^2 \times 7 \times 11$
$\text{HCF} = 2^3 \times 3$
[take common prime factors and lowest power of each]
$\text{LCM} = 2^6 \times 3^2 \times 5^2 \times 7 \times 11$
[take all prime factors and highest power of each]

Examples of square roots and cube roots using prime factorization:

$$\begin{aligned} 54756 &= 2^2 \times 3^4 \times 13^2 \\ \sqrt{54756} &= 2 \times 3^2 \times 13 \\ &= 234 \\ 1728 &= 2^6 \times 3^3 \\ \sqrt[3]{1728} &= 2^2 \times 3 \\ &= 12 \end{aligned}$$

Approximation

Significant Figures

Rules of identifying number of significant digits:

1. All non-zero digits are significant.
2. Zeros between non-zero digits are significant.
   Eg. 302 (3 sf)
   Eg. 10.2301 (6 sf)

3. In a whole number, zeros after the last nonzero digit may or may not be significant. It depends on the estimation being made.

   Eg.

   7436000 = 7000000 (1 sf)

   7436000 = 7400000 (2 sf)

   7436000 = 7440000 (3 sf)

   7436000 = 7436000 (4 sf)

   7436000 = 7436000 (5 sf)

   7436000 = 7436000 (6 sf)

4. In a decimal number, zeros before the 1^{st} non-zero digit are not significant.

   Eg. 0.004 (1 sf)

   Eg. 0.07008 (4 sf)

5. In a decimal number, zeros after the last non-zero digit are significant.

   Eg. 6.40 (3 sf)

   Eg. 12.000 (5 sf)

   Eg. 20300.000 (8 sf)

   Eg. 0.0700800 (6 sf)

Decimal Place Rounding

Examples:
0.7374 = 0.74 (2 dp)

58.301 = 58.30 (2 dp)

207.6296 = 207.630 (3 dp)

207.6296 = 207.63 (2 dp)

207.977 = 208.0 (1 dp)

207.977 = 207.98 (2 dp)

18.997 = 19.00 (2 dp)

Standard Form

$\pm A \times 10^n$, where $1 \leq A < 10$ and n is an integer.

Examples:
$1350000 = 1.35 \times 10^6$

$0.000375 = 3.75 \times 10^{-4}$

Common Prefixes

10^{12}	trillion	tera	T
10^9	billion	giga	G
10^6	million	mega	M
10^3	thousand	kilo	k
10^{-3}	thousandth	milli	m
10^{-6}	millionth	micro	μ
10^{-9}	billionth	nano	n
10^{-12}	trillionth	pico	p

Indices

Rules of Indices:

$$a^0 = 1$$

$$a^m \times a^n = a^{m+n}$$

$$a^m \div a^n = a^{m-n}$$

$$(ab)^n = a^n b^n$$

$$\left(\frac{a}{b}\right)^n = \frac{a^n}{b^n}$$

$$(a^n)^m = a^{nm}$$

$$a^{-n} = \frac{1}{a^n}$$

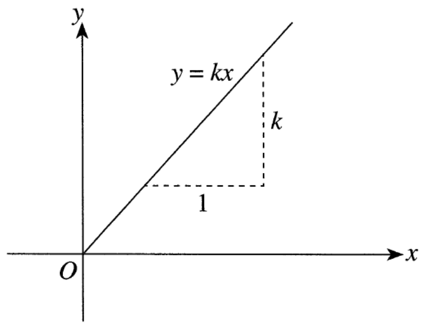
$$\left(\frac{a}{b}\right)^{-n} = \frac{b^n}{a^n}$$

$$a^{\frac{1}{n}} = \sqrt[n]{a}$$

$$a^{\frac{m}{n}} = \sqrt[n]{a^m} = (\sqrt[n]{a})^m$$

Direct and Inverse Proportion

If y is directly proportional to x, then $y = kx$, where k is a constant and $k \neq 0$. The ratios $\frac{x}{y}$ and $\frac{y}{x}$ are constant. Furthermore, the graph on y against x (or of x against y) is a straight line through the origin.



If y is inversely proportional to x, then $y = \frac{k}{x}$, where k is a constant and $k \neq 0$. The product xy is constant.
